

Residential Complex Pesniški dol – terraced houses, semi-detached houses and detached houses

Type of real estate:

Land for construction – residential use

Land surface area:

Apartments: 8,041.00m²

Building surface area:

1,595m²

The buildings are residential houses, each intended for one family. The entrance and garage of each house give access directly onto a public road. A projecting roof can also be built in front of the garage.

The houses have two floors – ground and first floor. Since a basement cannot be constructed, it is envisaged that there will be external storage in the extension of the garage.

The objective is to design a residential neighbourhood, which will consist of low-energy houses – therefore it is designed using the Porotherm insulating system, and insulating facades and windows are envisaged, as well as a method of heating, which will be in tune with the manner of construction.
